Car Number: Car
Policy Number: Insurance

Payment (Payment ID, Policy Number/Policy ID, Amount, Due Date, Policy
Payment ID) Foreign Key: Policy Number/Policy ID: Insurance

Problem 5 [20=5*4]

We have designed an eBay-like on-line auction database. **Answer the following queries with SQL.** (Note: Every auction listed in the system, sold, expired, or ongoing, is listed in Auction table. Auctions, whose items have been sold out, are also listed in Sold table.)

- Item (ItemID, ItemName, Description)
- User (Username, Email, Rating)
- Auction (AuctionID, ItemID, SellerUsername, Price, StartTime, EndTime)
- Sold (AuctionID, BuyerUsername, DateSold)

Write SQL statements for each of the following queries.

1. Find a distinct list of usernames of the users who participate in an auction. Note that a user may participate in an auction as either a buyer or a seller;

Select Distinct Auction.SellerUsername as username, Distinct Sold.BuyerUsername as username
From
Auction join Sold on Auction.AuctionId=Sold.AuctionID ;

2. Find a list of usernames of the sellers whose items have been sold;

Select Distinct Auction.SellerUsername as username From Auction join Sold on
Auction.AuctionId=Sold.AuctionID ;

3. Find usernames of the users who have a rating higher than 4.5;

Select Username from User where rating>4.5

4. Find the ItemName of the highest priced item, along with the Username of the corresponding user selling the item. Note that there may be more than one item at the highest price, in which case, you must return the information for all items.

Select Item.Itemname, Sellerusername from Item join Auction where price in (select
max(price) from Auction);
